

ABSTRACT

An interpreter portion obtains page description language data that includes image data of an image source and image-size specifying data of both the image source and
5 a device image. The interpreter portion generates intermediate data based on the image data of the image source and the image-size specifying data. If the image-size specifying data specifies enlargement from the image source to the device image, the interpreter portion
10 generates the intermediate data that includes intermediate image data that is the same data as the image source data and enlargement ratio data. A rasterize portion generates print data in an output memory based on the intermediate data.
